- I enjoyed cleaning and pre-processing the data. Before I write my code, I write the steps I want to take, sketch what my table should look like. I enjoy putting my thoughts on a paper and that really helps my coding process and helps me break down my code into small chunks.
- I also enjoyed the plotting part. I found it to be very challenging. One reason I found it challenging was that I could not color the point of the plot based on their position on the plane. This part was the most challenging part and took the longest and did not accomplish it.
- I was initially confused with understanding what the original plot was showing, it took me a while. Finding a similar type of dataset was easy.
- I also found documenting this code challenging.
